          bubble_sort(values.begin(), values.end(), compGreater);
           for (auto it = values.begin(); it != values.end(); ++it) {
               std::cout << ' ' << *it;
           std::cout << std::endl;</pre>
           getchar();
```

- 1. Homework13.cpp ⁵⁸
- 맨처음 homework13.cpp를 해결하기 위해 오류가 발생하는 부분부터 확인을 했는데 오류가 나는 원인은 main함수 부분에서 compLess와 compGreater를 선언해주는데 해당 객체가 없어서 오류가 발생을 하였다.
- 그래서 compLess와 compGreater Functor를 만들면 해결을 할수 있겠다고 생각을 하였다.

```
template <typename ForwardIterator, typename Compare>

void bubble sort(ForwardIterator first, ForwardIterator last, Compare comp) {

- for (auto sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first != last; last = sorted) {

- sorted = first; first | last |
```

- Functor를 어떻게 구현을 해야할지를 확인하기 위해 bubble_sort함수의 compare가 사용되는 부분을 확인하였다.
- 확인을 해봤더니 if문안에서 비교하는데 사용이 되었다.
- 그래서 compLess는 내림차순으로 정렬이되게, compGreater는 오름차순으로 정렬이 되게 각각 functor를 구현하였다.

실행결과.

```
→ WEEK13 git:(master) x g++ homework_13_01.cpp -std=c++17

→ WEEK13 git:(master) x ./a.out
sorted Ascending
7 6 5 4 3 2 1 0
sorted Descending
0 1 2 3 4 5 6 7
```
